

Notes:

- Because it was created by the 4 team members, some details were omitted.
- In the problem, several classes were mentioned, but it was decided to merge some into one (Agency in Reservation and Garage in Car), since having only one attribute (Agency and Garage), those classes can be turned into attributes of another class.
- In the Client class, the same class is called in the Guarantee attribute, and in code that's fine, but for a diagram, it should be done differently.
- The relationship between Reservation and Car was questionable for the professor, since it makes more sense for the relationship to be one of dependency rather than aggregation (used in the diagram).
